Research Interests

My research is in natural language processing (NLP) and machine learning (ML) / data science, with an emphasis on applications in health informatics. In short, there are too few biomedical experts to make sense of the torrents of available health-related data and I am interested in mitigating this problem via novel computational approaches. For example, a large ongoing project of mine aims to semi-automate aspects of the evidence-based medicine pipeline via innovative ML methods. Another example of this research motif is my work developing statistical models of patient-doctor communication, ultimately with the aim of improving it. Furthermore, I have multiple ongoing projects that use NLP to analyze data from the web relevant to the patient experience. More generally, I work on core NLP and ML problems, e.g.: structured and unstructured classification techniques; semi-supervised learning; learning from imbalanced data; and interactive learning to make the best possible use of human time and expertise in hybrid human/computer systems. Most recently, I have been working on convolutional neural models for textual data. In general, I tend to be most excited by interdisciplinary research that motivates technical questions by way of interesting applications.
